

Hardtop Bracket Installation Instructions

1. Remove existing hardware from hardtop and vehicle.

2. Place the hardtop onto the vehicle in the position that it will be installed.

3. Front brackets are labeled L (left) and R (right). As you sit in the driver's seat you will place the front bracket L onto the hardtop and align it with the existing holes and attach with bolts provided. Align the holes on the lower part of the bracket with existing holes on the windshield frame and attach with bolts provided. Don't tighten lower bolts on all brackets until installation is complete.

4. Sitting in the passenger's side, attach front bracket R in the same manner as in the previous step 3.

5. The small side straps will align with existing holes on the vehicle and hardtop where the stock latch was removed (step 1). Using bolts that are provided, attached the side straps.

6. When all brackets are in place, fully tighten all bolts.

Some roll cage construction may require that you install the front brackets onto the hardtop before it is placed on the vehicle. After doing this you can place the hardtop on the vehicle and attach the lower bolts to the windshield frame. Your installation will be complete after installing the side straps and all bolts are tightened.
