

5X Racing Miata Coil-on-Plug Cover Installation Instructions

Thank you for purchasing our unique, aluminum race inspired coil-on-plug cover for your 2001-2005 Mazda Miata! These instructions will guide you on how to properly install the cover on your Miata.

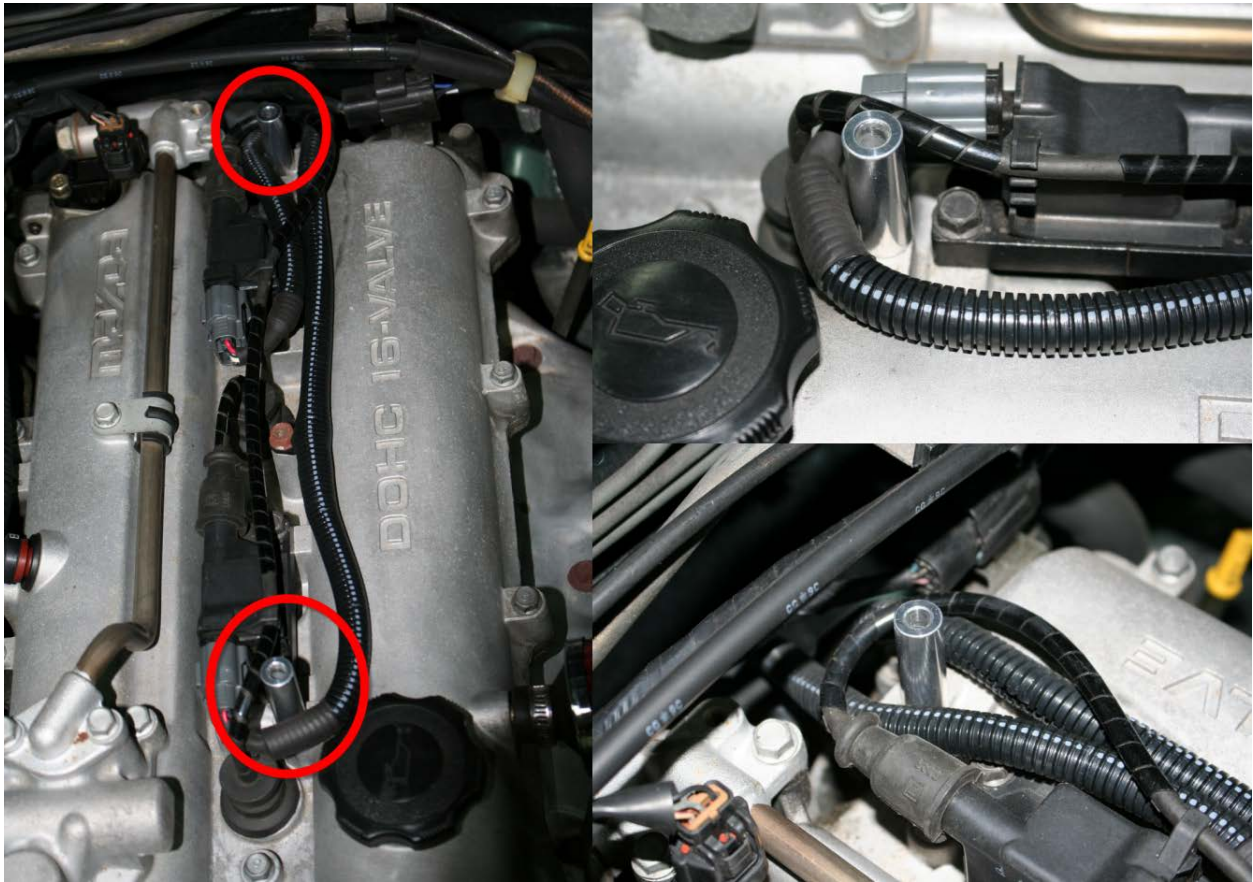

Tools Needed:

- T5 Allen Head driver

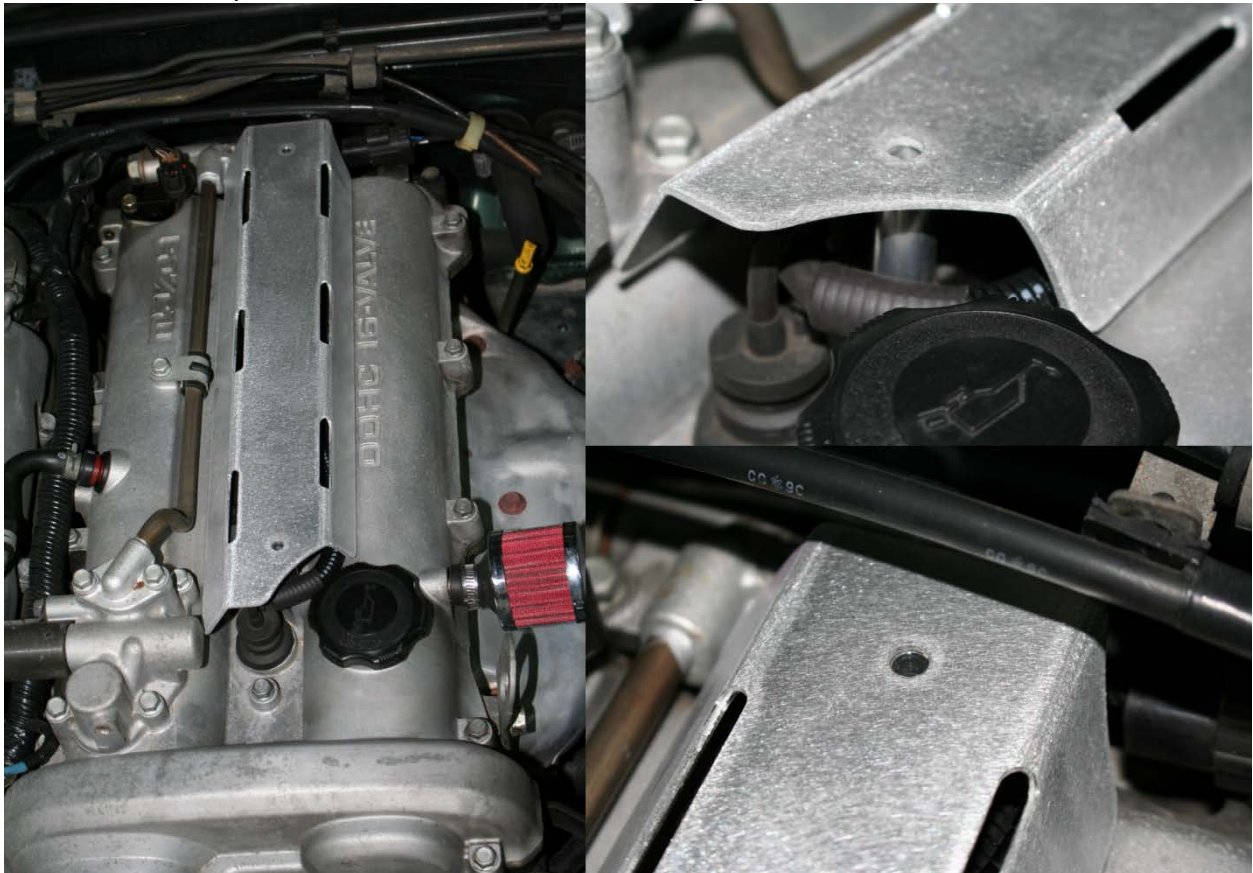

1. Locate the bolt holes on the front and rear of the valve cover. These will be the holes you use to mount the cover to. You might have to reroute or push the wiring to the side to allow installation of the cover as the mounting points are somewhat hidden by the wiring

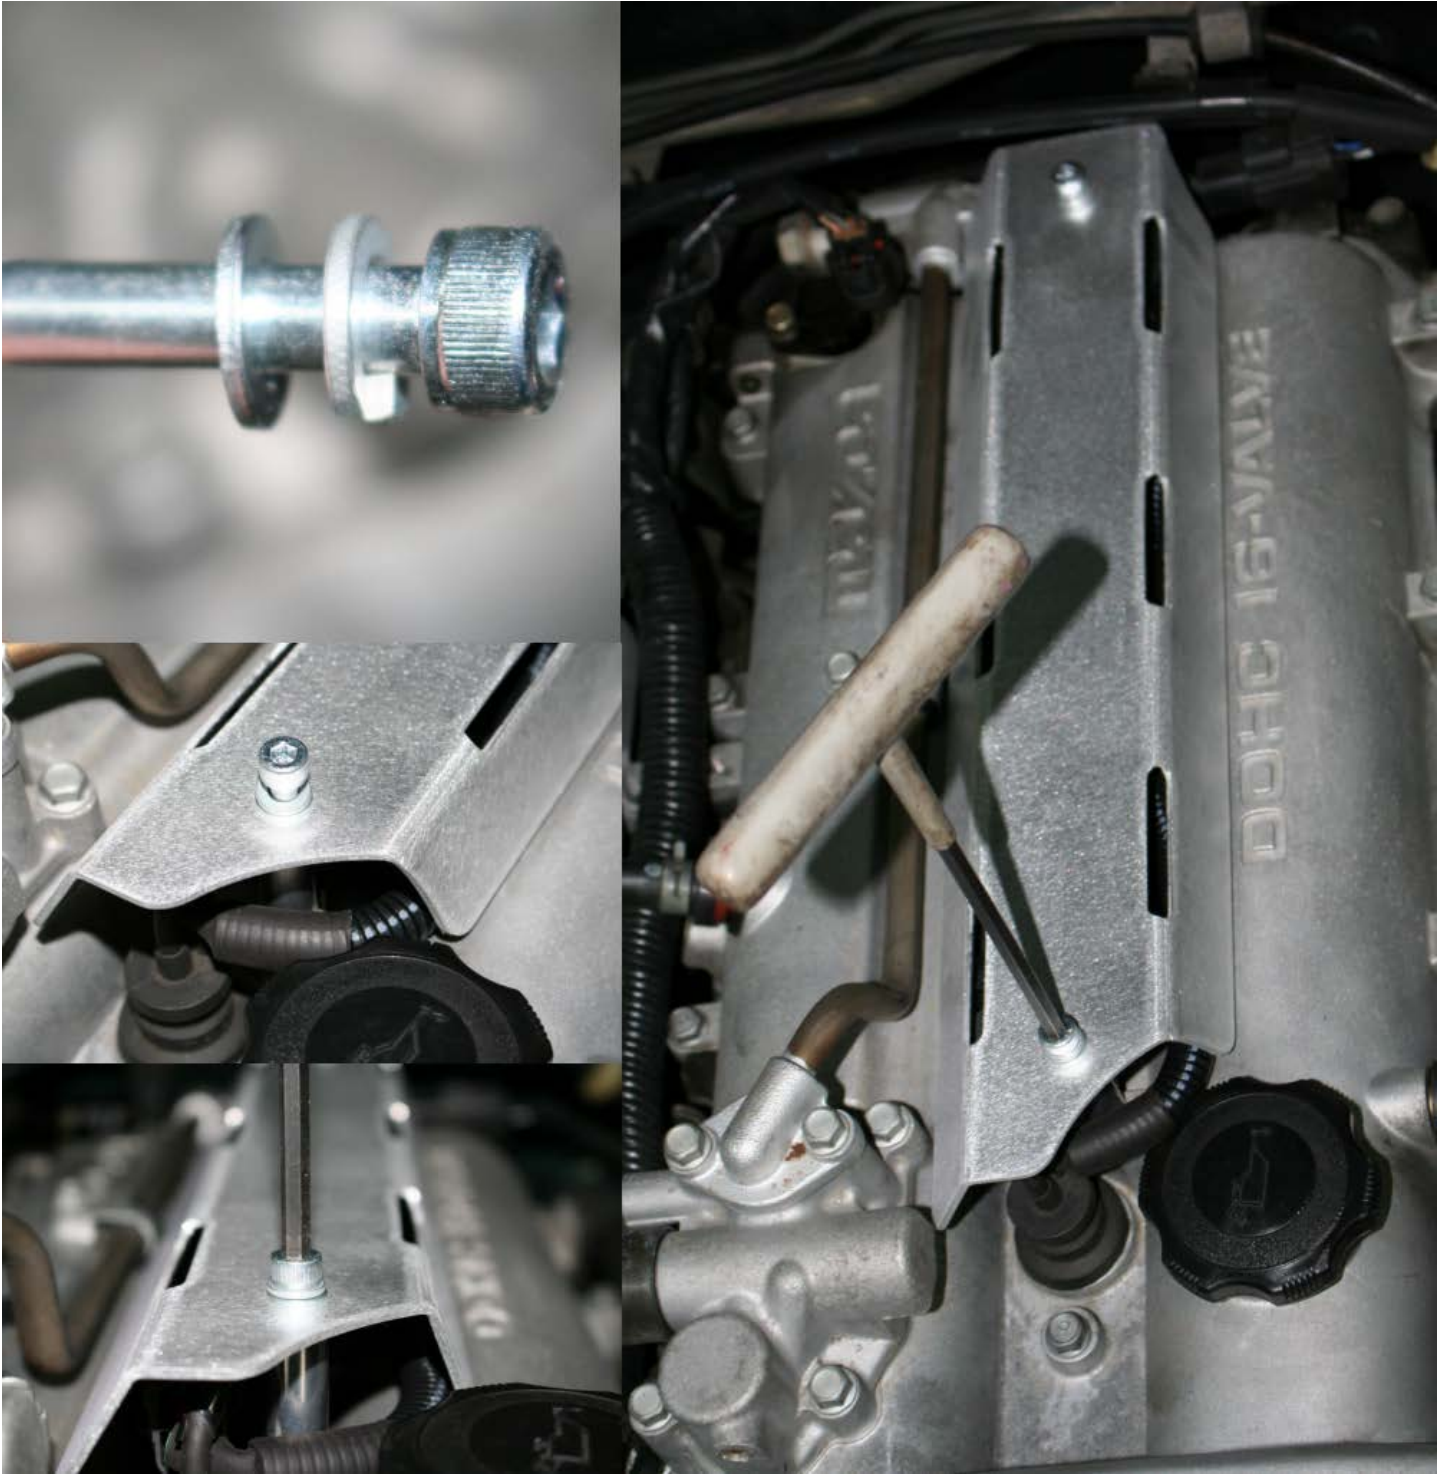

2. Place the aluminum spacers on the mounting points and line them up with the bolt holes underneath

3. Fit the coil cover (notched side forward) on top of the spacers taking care to line up the bolt holes. The coil cover holes, spacer holes, and threaded mounting holes in the valve cover should be in-line

4. Find the allen bolts and install the lock washer first, then the flat washer, and slide the assembly through the cover and spacer on both the front and back mounting holes. Hand-tighten the bolts to ensure they're threaded, then use the T5 Allen head driver and tighten until the lock washer compresses. Do not overtighten as the aluminum in the valve cover might strip

5. This completes the installation. Enjoy, and thanks for purchasing 5X Racing products!
